GMS-10 RVS Series

Oxygen Sensors Accurate oxygen measurement

produces the 700 °C required for the ZrO₂ to operate as an O₂

pump. The time taken for the pump to achieve specific

minimum and maximum pressures within this chamber is a

measure of the partial oxygen pressure of the environment.

The GMS-10 has to be operated by an electronic measuring

processing. This circuit can either be incorporated into the

customer's own electronics, or be purchased as a separate

circuit that controls the sensor operation and signal

DESCRIPTION

The GMS-10 is a high-accuracy oxygen sensor suitable for many applications. Originally developed for boiler applications, the product range has been extended to offer versions suitable for oxygen monitoring on board commercial and military aircraft, exhaust gas testing for automotive and medical test equipment. The sensor employs two ZrO₂ discs with a small hermetically sealed chamber in between. One of the discs functions as a reversible oxygen pump, which is used to successively fill and empty the chamber. The second disc measures the ratio of the partial pressure difference and generates a corresponding sense voltage. A heat element

FEATURES

- High-accuracy measurement
- Low power consumption
- No reference gas required
- Linear output signal
- No need for temperature stabilization
- Function testing and calibration in ambient air
- Long life

TYPICAL APPLICATIONS

box of electronics from Honeywell.

- Heating boiler control
- Industrial process control
- · Control of aircraft on board oxygen generation systems
- · Automotive exhaust gas diagnostics
- Service instruments
- Monitoring environmental oxygen

WARNING MISUSE OF DOCUMENTATION

- The information presented in this product sheet is for reference only. Do not use this document as a product installation guide.
- Complete installation, operation, and maintenance information is provided in the instructions supplied with each product.

Failure to comply with these instructions could result in death or serious injury.

WARNING PERSONAL INJURY

DO NOT USE these products as safety or emergency stop devices or in any other application where failure of the product could result in personal injury.

Failure to comply with these instructions could result in death or serious injury.

MF010 Series Low Temperature and MF020 Series High Temperature

Oxygen Sensors

DESCRIPTION

The MF010 Series Low Temperature Oxygen Sensors is designed to determine the oxygen concentration in air or inert gas mixtures with temperatures of -100 °C to 250 °C [-148 °F to 482 °F] max. The MF020 Series High Temperature Oxygen Sensors is designed to determine the oxygen concentration in air or inert gas mixtures with temperatures of -100 °C to 400 °C [-148 °F to 752 °F] max.

These products are particularly suitable for measuring oxygen in areas that are not easily accessible, or in closed systems, such as ventilation pipes and containers. The MF010 and MF020 Series may both be supplied with a measuring range of 0.1 vol%O₂ to 25 vol%O₂ and 0.1 vol%O₂ to 100 vol%O₂. The entire measurement range is linear for both series.

The sensor detects the gas mixture's oxygen partial pressure (absolute oxygen content) by using a dynamic process that occurs on two zirconium dioxide discs which form a hermetically sealed chamber. Because no chemical substances are used, the sensor exhibits significantly longer service life than an electrochemical sensor.

The actual oxygen sensor is mounted in the tip of the bar probe and is protected by a stainless-steel sintered disk which serves as a flame back-flash stop. The water-proof plastic housing accommodates the electronics and is mechanically connected to the bar probe.

FEATURES

- No moving parts
- Low power consumption
- No need for temperature stabilization
- Functional testing and calibration in ambient air
- Long life

Sensor electronics include:

- 1. Signal amplifier
- 2. Control for the ionic pump with an analog component
- Test component
- 4. Internal monitoring logic component
- 5. Power supply for the sensor heating element and the analog and digital components
- 6. Reset
- 7. Voltage monitor
- 8. Analog output
- 9. Bi-directional digital output
- 10. Internal potentiometer

The sensor outputs the measured values via an analog channel (4 mA to 20 mA or 0 V to 10 V) and a digital channel (also provides any error signals) which are evaluated and further processed in a user-specified external mounting device such as a fuel controller, display, measuring instrument, programmable logic controller or ventilation system.

Both series may be calibrated manually or self-calibrated using atmospheric air instead of a reference gas. The sensor can also conduct external operational self-tests.

Both series may also operate in a fault-proof mode. The sensor self-monitors during operation and provides error signal output. A second oxygen sensor is not necessary.

POTENTIAL APPLICATIONS

- Furnace/heating boiler control
- Industrial process control
- Combustion systems
- Compost systems
- Environmental control

Oxymac50, DE800 and Elecdit

Oxygen Sensor Interface Boards Accurate oxygen measurement

DESCRIPTION

The Oxymac 50, Elecdit and DE800 sensor interface boards are control and measurement devices for Honeywell's range of dynamic highly accurate oxygen sensors. The ability of these sensors to operate without any reference gas makes them ideal for many applications including combustion and environmental control.

Honeywell oxygen sensors using zirconia based sensing elements require external connection to an electronic measuring circuit to control sensor operation and signal processing. A heating element on the sensor produces the 700 °C required for the ZrO_2 to achieve its operational temperature. These interface boards supply the sensor with the necessary circuits to provide this control and processing, while also providing sensor calibration. The DE800 interface also includes the heater supply, Oxymac50 and Elecdit require an external heater power supply.

FEATURES

- Provides the necessary circuits to control Honeywell oxygen sensors
- Functional testing and calibration in ambient air
- PCB board format
- Linear output of measured oxygen content in voltage or current format
- Low power consumption

TYPICAL APPLICATIONS

- Heating boiler control
- Industrial process control
- Combustion systems
- Compost systems
- Environmental control
- Medical
- Aerospace

Oxymac50 is a recently upgraded interface that offers similar performance to the Elecdit board but operates from a 24 Vdc power supply.

The DE800 interface offers the features of the Oxymac50 but also contains the heating element power source.

The Elecdit interface was developed for Industrial applications and offers a level of noise protection. It operates from a ± 15 V supply.

Oxymac50 and DE800 are the recommended interfaces for new applications.

The interfaces are supplied ready for mounting into customers' enclosures. Oxymac50 a 15-pin D type connector, DE800 has screw connector block and Elecdit has 2,5 mm x 2,5 mm (0.1 in x 0.1 in) pin connector.

BENEFITS

- Removes the need to implement sensor control circuits within customers' equipment
- Removes effects of barometric or application pressure changes and sensor drift for best accuracy
- · Ease of mounting and access for calibration
- Flexible interconnection
- Lower running costs

Oxymac50, DE800 and Elecdit

⁽¹⁾ Factory set to voltage or current output

OPERATING AND CALIBRATION NOTES

Oxymac50

- 1. Reset of the Oxymac50 is possible by putting the power off/on.
- 2. The output signal can be 0 V to 10 V or 4 mA to 20 mA. The output signal is factory set by the solder bridge JP1.
- 3. A proper operation of a connected sensor and electronic circuit can be tested with the test switch or with an external signal. After switching the test function the output signal should indicate a 20 % lower value.
- 4. LED indication proper sensor operation is indicated by blinking of LED D3.
- 5. Calibration sensor and Oxymac circuit can be calibrated in normal air. After a loss of power the Oxymac50 circuit stores the calibration value.

DE800

- 1. Heater adjustment the heater voltage of the sensor can be adjusted with pot meter PC419.
- 2. Test function after pressing the test button, the output has to go to a 20% lower output signal. Testing with an external (24 V) signal is possible via terminal TE.
- 3. Calibration the sensor can be calibrated in normal air with the calibration button. Calibration is lost after power loss.
- 4. LED -if the sensor is functioning properly, the LED D4 is blinking.
- 5. Signal out if the sensor is functioning properly a pulse signal can be measured at terminal K2.

Elecdit

Adjustment/calibration procedure. The interface is factory set, for sensor replacement follow these instructions.

- 1. Adjust with Pot1 12 V (internal ±6 V) at Pin 2.
- 2. Adjust with Pot2 reference at Pin 1 to 10 V ± 0.2 V.
- 3. After approx 60 s an impulse (blinking) signal should be present at Pin 1. Apply at the sensor 95 mbar air, adjust with Pot5 at Pin 9 to 0.8 V. Then apply at the sensor 1013 mbar air and adjust with Pot3 at Pin 9 Uout to 8.3 V.
- 4. Adjust with Pot4 0 mV at Pin 10.
- 5. Adjust with Pot5 Uout to 0 V at Pin 9.
