Arc Guard System™ with communication module

Monitor your installation, anytime and anywhere

ABB is a leader in electrical safety with the TVOC-2 Arc Guard System™ providing an unrivaled optical arc mitigation device with SIL-2 safety certification.

The plug-in communication module provides operators real time status updates and instant information regarding the location of any arcs.

Safety and protection

Saving lives and minimizing damage to equipment

With a market-leading reaction time of under 1 ms, TVOC-2 is already the fastest, most reliable arc guard solution available on the market. By adding the communication module, information regarding any trip travels faster, reaching the right people sooner.

Continuous operation

Keeping the business running

An arc flash accident can have a catastrophic effect on equipment and lead to outages. The TVOC-2 detects the light from an arc flash and, together with the installed breaker, cutting the current feeding the arc extremely quickly, minimizing disruption of the system.

Easy to install

Factory calibrated sensors

Configuration of the TVOC-2 is done in minutes and with the HMI verifying every setting done, it is extremely unlikely that mistakes will happen during the configuration. With the possibility to accommodate up to 30 sensors, the system is highly flexible and can grow with any system.

Paper machine

Steel industry

Introduction

TVOC-2, ABB's Arc Guard System™, builds on the well known TVOC design. Its functions and features improve an already great product, putting even more focus on reliability, flexibility and simplicity.

Arc Guard System™ increases the protection of people and equipment, and minimizes unnecessary production stops. TVOC-2 is ABB's state-of-the-art solution for arc fault protection in all applications, providing functional safety.

With over 40 years of experience, Arc Guard System™ has become an industry standard in several key markets, helping to protect personnel and businesses around the world.

Typical applications include all low- and medium-voltage switchgears.

Reliability

- Certified according to functional safety (SIL-2) standard
- Over 40 years experience in Arc Guard Systems™
- Pre-calibrated optical sensors

Flexibility

- With IP54 high protection degree, HMI (Human Machine Interface) can be mounted on the panel door
- COM Module operates in the same way as HMI. With added ability to communicate with a remote station using Modbus RTU
- Expandable with up to 30 optical sensors
- Configure the system according to various needs

Simplicity

- User-friendly start-up menu
- DIN-rail or wall-mounted
- Easy to expand as the switchgear functions are added

System description

Short-circuit faults in LV and MV switchgears are often accompanied by an electric arc. An arc fault can lead to considerable damage to equipment and injury to personnel unless it is detected very quickly. To avoid serious damage and give the person involved a good chance of surviving the accident without severe injury, the fault should be disconnected as fast as possible, typically in less than 50 ms.

The Arc Guard System™ quickly detects an arc fault and trips the incoming circuit-breaker. Using light as the main trip criteria, it trips almost instantaneously. Thanks to this key functional advantage, it overrides all other protections and delays, which is crucial when reaction times need to be measured in milliseconds.

How it works

The system acts in three phases:

1 Detection

The TVOC-2 detects the light from an arc flash

2 Recognition

The system determines the intensity of light

The diagram below shows how the exponential increase in energy over time affects different switchgear materials.

Total clearing time = ABB Arc Guard System™ + breaker

3 Action

The system sends signal to trip breaker(s)

Functionality

Arc monitor

With its modular concept, the Arc monitor is designed to fit all types and sizes of low- and medium-voltage switchgears.

It is designed according to functional safety, and is SIL 2-certified according to IEC 61508 and IEC 62061 which puts full focus on reliability. This corresponds to performance level d according to EN ISO 13849-1. Safety functions are exclusively handled by hardware. In addition, the system, trip logs and user-interface are all microprocessor-monitored.

The system can be configured to trip selected breakers, depending on which sensor that detects the light. The DIP-switches that take care of this function also handle settings like auto-reset and Current Sensing Units (see pages 12-13 for more details).

Energy is stored in the unit for operation up to 0.2 s if the supply voltage fails. This is sufficient to close the tripping circuit even if voltage disappears at a short-circuit fault.

Note: The circuit breaker still needs a back-up energy source for its tripping circuit.

Connections

All connections can be accessed from the front of the Arc Guard System™. Pluggable terminal blocks allow electrical wiring before mounting TVOC-2 into the cabinet. The solid state tripping contacts are type IGBT, which guarantees fast and reliable tripping.

More details can be found on page 8, technical data.

HMI (Human Machine Interface)

- Handles settings with key-pad and full text display
- Holds error log and trip information after power loss
- Error log and trip log include time/date stamp from a real-time clock
- TVOC-2 can handle two separate HMIs (cabinet door and on product)
- Three-meter cable included
- COM Module available using Modbus RTU

Sensor & sensor modules

- Fiber-optic sensors not affected by electrical noise
- Pre-calibrated sensors remove need for manual configuration
- Up to 30 detectors can be connected

Current Sensing Unit (optional)

The Current Sensing Unit (CSU) is an accessory needed only in those few specific applications where strong light is expected on a regular basis.

CSUs are connected with an optical fiber using light as signal for normal current. If this was removed by accident, the system would treat it as an over-current and trip if an arc flash is seen of reliability reasons.

Adding a CSU will result in an additional operating time depending on the size of the over-current and the number of phases measured.

Arc monitor

- 3 IGBT solid state tripping contacts
- 2 change-over trip signal relays
- 1 change-over self supervision alarm relay (IRF)
- 2 current sensing unit inputs
- 1 current sensing unit output

Mounting alternatives

- DIN-rail
- Wall mounting

IEC 61010-1		Safety requirements for electrical equipment for measurement, control and laboratory use

Applications

Basic installation tips

Arc monitor (TVOC-2)

The Arc monitor can be mounted anywhere in the switchgear, e.g. in the breaker cubicle or in a separate control cabinet. Tripping is handled by a separate tripping circuit. The task of the Arc monitor is to close the circuit very quickly. You can connect up to 3 breakers in this way and, if required, trip different breakers depending on where the arc occurs.

CSU (Current Sensing Unit)

The CSU is an accessory used if you cannot prevent direct sunlight or other highly intensive light reaching the sensors frequently. CSUs can be mounted in series if more than two are needed.

Connection of current transformers (for CSU)

The CSU measures either 1, 2 or 3-phase. Three-phase is, however, preferable for reasons of safety and reliability. Current transformers with a secondary current of 1, 2 or 5 A are used for this purpose.

Note: Current transformers for relay protection are preferable since they do not saturate as quickly as standard current transformers. The transformers should not saturate before at least twice the set over-current level.

Detectors

Detector cables are available in standard lengths (see ordering details). They cannot be cut or joined. Avoid sharp bends or pinching when installing the cables.

The plastic fiber is made of polymethylene acrylate (PMMA) with a polyethylene jacket. Each detector consists of an optical cable and a lens that are calibrated together to give the same sensitivity independent of cable length. The detector has a plug-in connector that fits the Arc monitor. The lens collects light from all directions, with the exception of a small shaded area behind the detector (see the polar diagram). Practical experiments have shown that arc light reflected between metallic surfaces is normally sufficient to cause tripping.

Detector positioning

The basic strategy for positioning the sensors is to make sure to cover all parts that may suffer from an arc. Typically this involves the horizontal and vertical bus bar system and the breaker cubicle. If possible, it's also normally preferable to supervise each cubicle. Avoid placing the detector so that it sees the normal light from a breaker. The sensor can detect arcs within a 3-meter distance (see illustration). To raise the safety level even higher, you can separate them at a 1.5-meter distance, thereby creating redundancy between them.

Configuration

Trip condition configuration – Manual/auto reset configuration

System configuration using DIP switch

DIP switches are used to configure the system regarding use of current condition (activated CSU inputs) and assigning detectors to breaker trip outputs (so-called selectivity). They are located on the front (low, left) of the Arc monitor.

DIP switches

Sw1	Current condition inputs Terminals X1:21-22	Sw5	Not used
Sw2	Current condition output Terminal X1:23	Sw6	Autoreset K2, K3 (signal relays)
Sw3	Trip output assign	Sw7	Not used
Sw4	Trip output assign	Sw8	Not used

Breaker trip output

Breaker trip output	Detector inputs
Output relay K4	Terminals X1:1-10
Output relay K5	Terminals X2:1-10
Output relay K6	Terminals X3:1-10

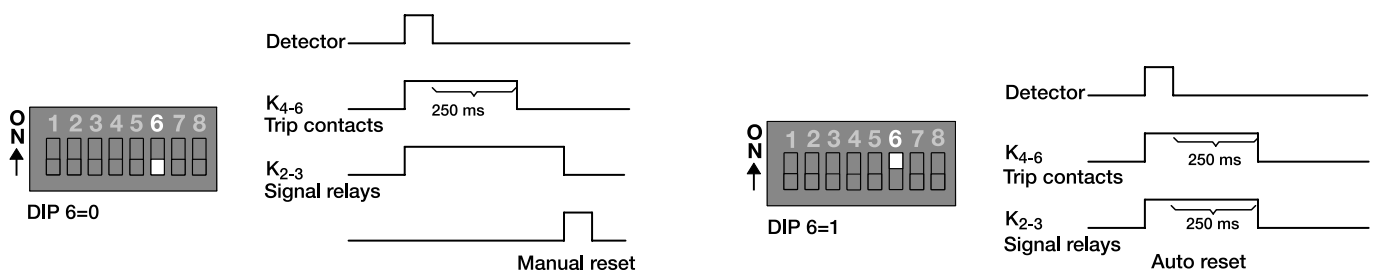

Trip condition configuration

TVOC-2 can be configured to trip selected breakers depending on which detector is signalling for an arc. This can be used to trip sections of a switchgear or use one monitor for several small switchgears. It also has an option to add a current condition, see page 13.

Symbol description		Configurable tripping relays			
= Arc detected = Arc not detected

	1	0			

Manual/auto reset configuration

The signal relays K2, K3 can be configured to react as the trip contacts (auto reset) or to be de-energized by manual reset on the HMI. See below for explanation.

Configuration

Current condition configuration

Normal trip configuration with additional current condition

A current condition is an option that could be used to avoid the risk of nuisance tripping due to strong light from other sources than arcs. The main risks are light from arc chutes and direct sunlight, which in normal cases can be avoided. Therefore the standard configuration is without CSUs (Current Sensing Units).

All trip configurations on page 12 can be combined with an additional current condition. It is possible to connect up to two CSUs directly to the Arc monitor (AM) (input 21 and 22). To connect additional current sensing units in series is also possible if required. To share the current condition between different Arc monitors can be done by connecting output 23 on the first Arc monitor to the standard CSU input on the other. The Arc monitor will then block the trip condition until it sees an over current.

No current sensing unit		Sw1	Sw2	Function current condition
		0	0	Not used
One current sensing unit		1	0	Input CSU21 used
Two current sensing units		1	1	Both inputs used

AM (Arc monitor)

Special trip configuration depending on over current

The arc monitor has a special trip configuration that determines trips depending on where it sees the over current. This configuration will then trip different breakers depending on which supply is showing an over current.

Symbol description		Configurable tripping relays	
	Arc detected		
	Arc not detected		
	Configuration 4		<p>Any detector + current condition CSU21 operate K4 + K6</p> <p>Any detector + current condition CSU22 operate K5 + K6</p>
