Reduction in air consumption

Air consumption is reduced with a new original structure.

With this new original structure, running costs are reduced.

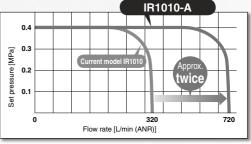

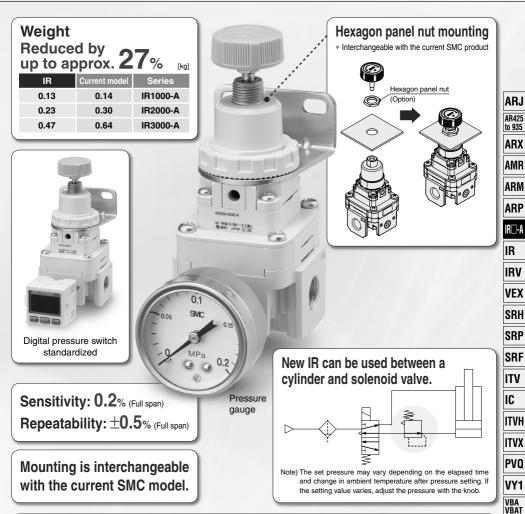

Flow rate: Up to approx. twice

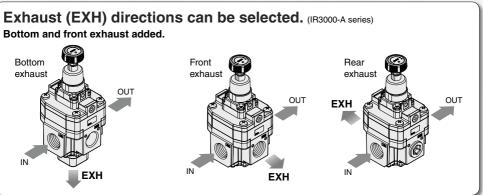

(Compared to the	(Compared to the current SMC product)			
IR	IR Current model			
720	320	IR1000-A

Note 1) This is an assembly of the bracket and set nut.

Note 2) \square in part numbers for a round type pressure gauge indicates a type of connection thread. No indication is necessary for R; however, indicate N for NPT.

A 1.0 MPa pressure gauge is fitted for 0.8 MPa setting. Please contact SMC regarding the supply of pressure gauge with psi unit specifications.

Note 3) In part numbers for a digital pressure switch indicates a type of connection thread. No indication is necessary for R; however, indicate N for NPT. For details on handling digital pressure switch and specifications, refer to the Best Pneumatics No. 8. Please contact SMC regarding the supply of digital pressure switch with unit conversion function.

Pressure Characteristics

Construction

Basic type (Knob): IR20□0-A

Working principle

When the knob is rotated, the flapper is pushed through the spring, and a gap is generated between the nozzle and flapper. The supply pressure flows to the inlet passes through the path between the nozzle and flapper and acts on the supply diaphragm as nozzle back pressure. The force generated by the diaphragm pushes down the valve, and the supply pressure flows to the outlet. The discharged air pressure acts on the exhaust diaphragm, and counteracts against the force generated by the supply diaphragm. The air pressure acts on the nozzle diaphragm at the same time, and counteracts against the compression force of the spring to adjust the set pressure. When the set pressure increases too much, the nozzle diaphragm is pushed up, and a gap is generated between the flapper and nozzle diaphragm after the flapper is closed. The balance of the supply diaphragm and exhaust diaphragm is lost when the nozzle back pressure flows into the atmosphere. The exhaust valve is open after the valve is closed, and excess pressure on the outlet is released to the air. Due to this pilot mechanism, fine pressure variations are detected and precise pressure adjustment is possible.

IR1000-A/2000-A/3000-A Series Made to Order

Please contact SMC for detailed dimensions, specifications, each part number and lead times,

arcusc	r idoffile grease
2 Secon	dary Battery Compatible
	0
Specification	s

Parts material | Material mainly composed of copper or zinc is not used. Parts surface treatment Zinc chromate or copper-based plating is not used. Grease Grease compatible with low dew point

Note 1) Electroless nickel plating is used

Note 2) Combinations with the pressure gauge are not available.

Fluororubber Specification

Fluororubber is used for rubber seal materials.

Non-grease Specifications

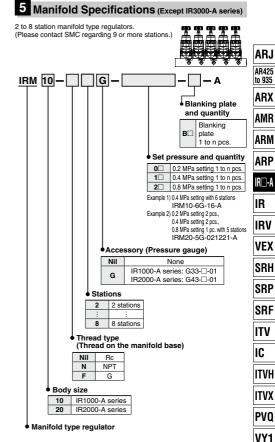

Note 1) Assembly is performed in a general assembly environment.

Note 2) Parts are not washed.

Note 3) Fluorine grease is used on some of the wetted parts (sliding parts) and non-wetted parts (threaded part on the setting knob).

specifications

Specifications					
Stations		2 to 8 stations			
	Common SUP	IR1000-A series: 1/4, IR2000-A series: 1/2			
Port	Individual OUT	IR1000-A series: 1/8, IR2000-A series: 1/4			
	Individual EXH (From IR body)				
Set pressure	0.2 MPa, 0.4 MPa and 0.8 MPa settings can be combined.				
Accessory (Pressure gauge)	G33-□-01(IR	G33-□-01(IR1000-A series), G43-□-01(IR2000-A series)			

Note 1) Regulators to be manifolded are counted starting from stations 1 on the left side with the OUT ports in front.

Note 2) When regulators with a different set pressure are manifolded, viewing OUT ports from front, the low pressure range is installed on the left side and high pressure range is on the right side. In case of the Example 2) above mentioned, stations 1 and 2 are of 0.2 MPa setting, stations 3 and 4 are of 0.4 MPa setting, and station 5 is of 0.8 MPa setting.

Note 3) For the model with pressure gauge (G), the pressure gauge is shipped together, but not assembled.

VBA

VBAT AP100

IR1000-A/2000-A/3000-A Series Specific Product Precautions 1

Be sure to read this before handling the products.

Refer to back page 50 for Safety Instructions and pages 387 to 391 for F.R.L. Precautions.

Piping

⚠ Warning

 Screw piping together with the recommended proper torque while holding the side with the female threads.

Looseness or faulty sealing will occur if tightening torque is insufficient, while thread damage will result if the torque is excessive

Furthermore, if the side with the female threads is not held while tightening, excessive force will be applied directly to piping brackets, etc., causing damage or other problems.

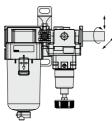

Recommended Proper Torque [N·m]						
Connection thread	nnection thread 1/8 1/4 3/8 1/2					
Torque 7 to 9 12 to 14 22 to 24 2						

Note) Tightening force for connecting to the EXH port of IR30 \square_2^1 -A is 8 to 10 N·m.

Do not allow twisting or bending moment to be applied other than the weight of the equipment.

Provide separate support for external piping, as damage may otherwise occur.

Piping materials without flexibility such as steel tube piping are prone to be effected by excess moment load and vibration from the piping side. Use flexible tubing in between to avoid such an effect.

∧ Caution

1. Preparation before piping

Before piping is connected, it should be thoroughly blown out with air (flushing) or washed to remove chips, cutting oil and other debris from inside the pipe.

Piping

⚠ Caution

2. Winding of sealant tape

When screwing piping or fittings into ports, ensure that metal chips from the pipe threads or sealing material do not enter the piping. Also, when the sealant tape is used, leave 1.5 to 2 thread ridges exposed at the end of the threads.

Operating Environment

⚠ Warning

- Do not use in an atmosphere having corrosive gases, chemicals, sea water, water, water steam, or where there is direct contact with any of these.
- 2. Do not operate in locations where vibration or impact occurs.
- In locations which receive direct sunlight, provide a protective cover, etc.
- In locations near heat sources, block off any radiated heat.
- In locations where there is contact with spatter from water, oil or solder, etc., implement suitable protective measures.

Air Supply

⚠ Warning

- Please consult with SMC when using the product in applications other than compressed air.
- Do not use compressed air which includes chemicals, synthetic oils containing organic solvents, salt or corrosive gases, etc., as this can cause damage or malfunction.
- If condensate in the drain bowl is not emptied on a regular basis, the bowl will overflow and allow the condensate to enter the outlet side. This will cause a malfunction of pneumatic equipment.

When removing drain is difficult, use of a filter with an auto drain is recommended.

⚠ Caution

- Condensate or dust, etc. in the supply pressure line can cause malfunctions. In addition to an air filter (SMC AF series, etc.), please use a mist separator (SMC AM, AFM series) depending on the conditions.
 Refer to "Air Preparation Equipment Model Selection Guide" (pages 2 and 3) for air quality.
- 2. When a lubricator is used at the supply side of the product, it can cause malfunctions. Do not use a lubricator at the supply side of the product. If lubrication is required for terminal devices, connect a lubricator on the output side of the regulator.

SMC

IR1000-A/2000-A/3000-A Series Specific Product Precautions 2

Be sure to read this before handling the products.

Refer to back page 50 for Safety Instructions and pages 387 to 391 for F.R.L. Precautions.

Maintenance

⚠Warning

- When the product is removed for maintenance, reduce the set pressure to "0" and shut off the supply pressure completely beforehand.
- When a pressure gauge is to be mounted, remove the plug after reducing the set pressure to "0".
- When using the regulator between a solenoid valve and an actuator, check the pressure gauge periodically. Sudden pressure fluctuations may shorten the durability of the pressure gauge.

A digital pressure gauge is recommended for such situation or as deemed necessary.

Handling

⚠ Caution

 When the precision regulator with pressure gauge is used, do not apply impact to the product by dropping it, etc. during transportation or installation.

This may cause misalignment of the pressure gauge pointer.

Operation

⚠ Caution

- 1. Do not use a precision regulator outside the range of its specifications as this can cause failure. (Refer to the specifications.)
- 2. When mounting is performed, make connections while confirming port indications.
- 3. When mounting the bracket or tightening the hexagon panel nut on the panel, tighten them to the recommended proper torque.

Looseness or faulty sealing will occur if tightening torque is insufficient, while thread damage will result if the torque is expessive

Recommended Proper Torque (N·m)

Set nut (for bracket)

IR10□0-A	IR20□0-A	IR30□□-A
2.0±0.2		
Hexagon panel nut (for knob type only)		

IR10□0-A IR20□0-A IR30□□-A 3.5+0.5

 After pressure adjustment, be sure to tighten the lock nut. When tightening the nut, tighten so that the knob does not move due to friction caused by tightening.

Operation

⚠ Caution

- 5. When pressure is applied to the inlet of a regulator, make sure that the output is connected to the circuit. Air blow occurs from the outlet and it depends on the operating conditions.
- The set pressure may vary depending on the elapsed time and change in ambient temperature after pressure setting. If the setting value varies, adjust with the knob.
- 7. If the directional control valve (solenoid valve, mechanical valve, etc.) is mounted and ON-OFF is repeated for a long time, the set pressure may vary. If the setting value varies, adjust with the knob.
- 8. There may be pulsation or noise depending on the pressure conditions, piping conditions and ambient environment. In this case, it is possible to improve the problem by changing the pressure conditions and piping conditions.

If the problem is not improved, contact your SMC sales representative.

- 9. The capacity of the output side is large, and when used for the purpose of a relief function, the exhaust sound will be loud when being relieved. Therefore, operate with a silencer (SMC AN series, etc.) mounted on the exhaust port (EXH port).
 - When using the IR1000-A and 2000-A series, contact your SMC sales representative.
- When installing a pressure gauge to the product, do not apply pressure more than the maximum display pressure. This will cause a malfunction.
- When using a precision regulator between a solenoid valve and cylinder, caution should be taken regarding the following points.
 - · The residual pressure of the cylinder will be exhausted from the regulator's exhaust port. (Depending on the conditions, partial backflow may occur.)
 - When holding pressure at the intermediate position of a closed center solenoid valve, due to reduced pilot pressure the pressure inside the cylinder will not be able to be held because the regulator will perform an exhaust operation. If it is necessary for the pressure inside the cylinder to be held, please consider using in combination with a separate shut-off valve.
 - When releasing pressure at the intermediate position of an exhaust center solenoid valve, depending on the conditions, vacuum pressure may remain inside the cylinder. If the introduction of atmospheric pressure is required, please consider using in combination with a separate atmospheric pressure introduction valve.
